LIVE ON ARC TESTNET

A rug-proof, USDC-native meme token launchpad on Arc · Encode Hackathon — August 2026

Memecoins are fun. Rug pulls aren't.

Launchpads made launching tokens effortless. They never made them safe — trust still rests entirely on the dev's word.

<2%

of pump.fun-style launches ever graduate — the rest fade out, or rug.

1 tx

is all it takes to pull liquidity on a classic DEX launch. Money gone, instantly.

12 words

before you can even start: seed-phrase-first UX locks out everyone but crypto natives.

The result: users assume every new token is a scam — because most are.

Rug-proof by **architecture**. Not by promise.

A pump.fun-style launchpad built natively for Arc — Circle's L1 where gas is USDC. Prices, fees and gas, all in dollars.

No LP to pull

There are no liquidity pools. Reserves are locked in the contract forever — nobody can withdraw them. Including us.

Anti-snipe built in

Every wallet is capped at 2% of supply during the first 20 blocks. Fair launches, by default.

Trust you can see

A live risk panel on every token: dev holdings, top-wallet concentration, holder freshness — straight from the chain.

Safety is a property of the contract — not a checkbox on a website.

Launch in one transaction. Trade in the next.

1

Create

One transaction: name, symbol, image. Costs ~2M gas — about 10× cheaper than storing images on-chain.

2

Trade

Instant liquidity on a CPMM bonding curve seeded with a 4,000 USDC virtual reserve. No order book, no LPs.

3

Graduate

At a 5,000 USDC reserve the token graduates — price discovery complete, history preserved on-chain.

Fee engine

1% fee on every trade

50% to the token creator — creators earn from day one.

50% to the platform.

Unclaimed creator fees sweep to the platform after 7 days.

Bonding curve math runs fully on-chain — the frontend just reads events.

Radically on-chain. Radically cheap.

~10×

cheaper launches. Token images & comments live in event logs, not contract storage: ~20M gas became ~2M.

0

backend servers. The site is fully static — the entire market state is rebuilt in your browser from on-chain events.

28/28

Foundry tests green. Bonding curve, fees, anti-snipe, multi-owner and sweep logic all covered.

On-chain comments — event-only, spam-gated by holding or creating the token

RPC resilience layer — request queue, backoff, and rate-limit-friendly batching

Candlestick charts, sparklines and a live trade rail — indexed client-side

For everyone — not just crypto natives.

The biggest launchpad gap is onboarding. We closed it.

Continue with Google

Two clicks to a real wallet. Web3Auth embedded wallet — no extension, no seed phrase, nothing to install. Live and tested.

Every wallet welcome

EIP-6963 multi-wallet discovery: MetaMask, OKX, Rabby and friends, side by side. Same trading code on every path.

Funding built in

Balance chip with a Circle faucet panel on testnet — the app notices your USDC arriving within 15 seconds.

Mainnet-ready. Literally on autopilot.

Arc mainnet isn't live yet. The moment it is, A NEW ONE launches itself — zero humans in the loop.

Detection to launch: ~minutes. Double-spend-safe bridging, kill-switch included.

\$NOAH and the Boarding Pass

Noah's Arc

"Everyone's boarding the Arc. Two by two."

The platform's first token — launched by us, under the same rules as everyone else.

Hand-drawn storybook art, served as rich on-chain metadata.

Dev buy happens in the creation transaction itself: nobody can snipe it first.

Boarding Pass campaign

The 33 most active testnet wallets board first: on mainnet day they enter a draw for 90k / 60k / 30k \$NOAH.

Activity is counted from on-chain events only — launches and trades, snapshotted daily.

Live leaderboard at anewone.xyz/boarding — testnet users are already competing for mainnet rewards.

Where we are — and where this goes.

LIVE TODAY

- Full launchpad live on Arc testnet — anewone.xyz
- V2 trading UI: candles, sparklines, live trade rail, trending spotlight
- Google login + multi-wallet onboarding
- Trust panel, on-chain comments, creator fees
- Open source — github.com/izzetcakmak/anewone

NEXT

- Mainnet day: automated launch pipeline fires the moment Arc goes live
- Client-side CCTP funding — bridge USDC in from any chain, in-app
- Fiat on-ramp via Circle — closing the biggest launchpad gap for mainstream users
- Creator profiles grow into reputation — dev history as an on-chain trust signal

Built solo. End to end.

izzet çakmak — solo builder

Solidity contracts and the full Foundry test suite · vanilla-JS frontend with a browser-side indexer · mainnet-detection and CCTP bridge automation · brand, art and motion design. Shipping on Arc since testnet day one.
